# PLANT

Plant your plants as soon as possible! Store plants in the shade and check frequently for moisture if not planting right away. On hot days, you may need to water them more frequently.

## SHRUB PLANTING

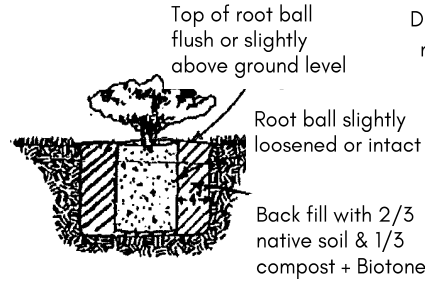

## TREE PLANTING

# MULCH

Add up to 3 inches of mulch around the base of the plant. Keep mulch a few inches away from trunk/stem. Mulch reduces weeds and conserves soil moisture.

# MULCH

Add up to 3 inches of mulch around the base of the plant. Keep mulch a few inches away from trunk/stem. Mulch reduces weeds and conserves soil moisture.

# WATER

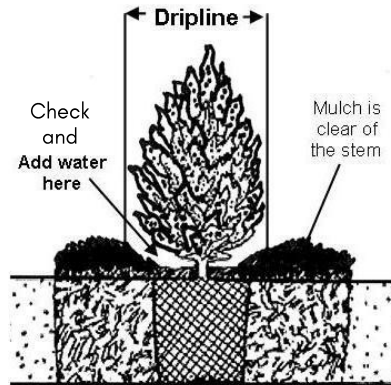

1 inch of water a week is recommended. Warm/windier weather may require more frequent watering.

# WATER

## Shrubs

After planting, check soil moisture often. It takes several weeks for a plant to get established. Check by sticking your finger down into the root ball. If moisture in the root ball is present, 2 inches down, don't water.

- It's critical to get water to the root ball rather than the surrounding soil. Even if it rains you will probably need to water (see right). **The warmer/windier the weather, the more often watering may be needed.**

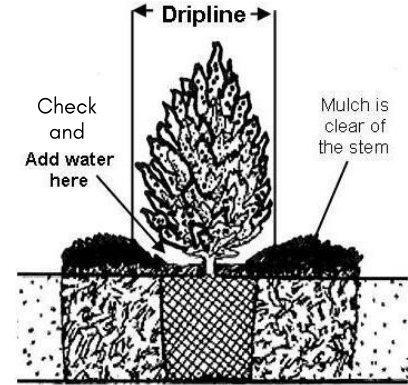

## Trees

5 gallons every week. Always check the soil before watering. If it's moist 2 inches down into the root ball, don't water. It is important to water deeply once or twice a week instead of a little everyday.

# FALL CARE

It's **very important** all trees and shrubs go into winter with ample moisture.

You want 1-inch of precipitation of water a week from mid-September until the ground freezes.

It's **especially important** that all evergreens are watered well late into the fall.

Apply protective tree wrap late in the fall to help protect against sun scald and rodent and rabbit damage during winter. Remove wrap by the end of April. Continue this every year until the bark begins to roughen. The wrap should extend from the ground up to the first tier of branches.
